Import Data Using Transform Maps (Spreadsheet)

Phase 8 - Project Demonstration Phase

1. Demonstration Overview

The **Project Demonstration Phase** explains the complete working of the **"Import Data Using Transform Maps (Spreadsheet)"** project.

The purpose of the demonstration is to show how spreadsheet data is imported into ServiceNow, how the data is stored in an Import Set Table, how the Transform Map maps and transforms the data, and how the final records are created or updated in the target table.

The demonstration should show the complete process from **source spreadsheet to final target records**.

Demonstration Flow

Spreadsheet → Data Source → Import Set → Import Set Table → Transform Map → Field Mapping → Transformation → Coalesce → Target Table

2. Objectives of the Demonstration

The main objectives are:

- Demonstrate spreadsheet data import.
- Show the Import Set process.
- Demonstrate the Import Set Table.
- Show the Transform Map configuration.
- Demonstrate source-to-target field mapping.
- Show data transformation.
- Demonstrate Coalesce functionality.
- Show new record creation.

- Demonstrate existing record updates.
- Show validation and error handling.
- Verify the final target records.

3. Demonstration Environment

The demonstration will be performed in a ServiceNow development/test instance.

Required Components

- ServiceNow instance.
- Sample Excel/CSV spreadsheet.
- Data Source.
- Import Set.
- Import Set Table.
- Transform Map.
- Target table.
- Sample valid and invalid data.

4. Demo Scenario

For the demonstration, consider an **Employee Data Import** scenario.

The organization maintains employee information in a spreadsheet and wants to import that information into a ServiceNow target table.

Sample Spreadsheet

Employee ID	Employee Name	Email	Department	Joining Date
E001	Arun	arun@example.com	IT	10-01-2025
E002	Kumar	kumar@example.com	HR	15-02-2025
E003	Priya	priya@example.com	Finance	20-03-2025

This spreadsheet will be used during the demonstration.

5. Step 1 – Prepare the Spreadsheet

The first step in the demonstration is preparing the source spreadsheet.

The spreadsheet should contain:

- Proper column headers.
- Valid data.
- Mandatory fields.
- Unique Employee IDs.
- Correct date formats.
- No unnecessary blank rows.

Demonstration Point

The presenter should explain:

“This spreadsheet acts as the source of data. Each column represents a field that will be mapped to a corresponding field in the ServiceNow target table.”

6. Step 2 – Configure the Data Source

The next step is to configure the **Data Source** in ServiceNow.

The Data Source identifies the spreadsheet as the source of imported data.

Demonstration Points

Show:

- Data Source configuration.

- Source file type.
- File format.
- Import Set Table.
- Source data structure.

Explanation

“The Data Source provides the connection between the spreadsheet and the ServiceNow Import Set process.”

7. Step 3 – Upload the Spreadsheet

Upload the prepared spreadsheet into ServiceNow.

After uploading the file, the system reads the spreadsheet data.

The uploaded data is then made available for Import Set processing.

Demonstration

Show the uploaded spreadsheet and confirm that the expected columns are available.

8. Step 4 – Run the Import Set

Execute the Import Set to load the spreadsheet data.

The Import Set receives the source data and places it into the Import Set Table.

Flow

```
Spreadsheet
     ↓
Import Set
     ↓
Import Set Table
```

Demonstration Point

Show that the records from the spreadsheet are now available in the Import Set Table.

9. Step 5 – Verify the Import Set Table

Open the Import Set Table and verify the imported data.

Example:

Employee ID	Employee Name	Email	Department
E001	Arun	arun@example.com	IT
E002	Kumar	kumar@example.com	HR
E003	Priya	priya@example.com	Finance

Explanation

“The Import Set Table acts as a temporary staging area. The data is stored here before it is transformed and transferred to the target table.”

10. Step 6 – Open the Transform Map

Next, open the configured **Transform Map**.

The Transform Map defines how the source data should be transferred to the target table.

The demonstration should show:

- Transform Map name.
- Source table.
- Target table.
- Field mappings.
- Coalesce configuration.
- Transformation logic.

11. Step 7 – Demonstrate Field Mapping

Show the source-to-target field mappings.

Source Field	Target Field
Employee ID	Employee ID
Employee Name	Name
Email	Email
Department	Department
Joining Date	Date of Joining

Explanation

"The Transform Map uses these field mappings to determine where each value from the Import Set Table should be stored in the target table."

12. Step 8 – Demonstrate Data Transformation

If transformation logic is configured, demonstrate how source data is converted before being stored in the target table.

For example:

```
Source Data
     ↓
Transformation Rule
     ↓
Target Format
```

Possible transformation examples:

- Date format conversion.
- Text standardization.
- Department value mapping.

- Removing unwanted spaces.
- Converting source values into reference values.

Demonstration Point

Show one example of source data and the corresponding transformed target value.

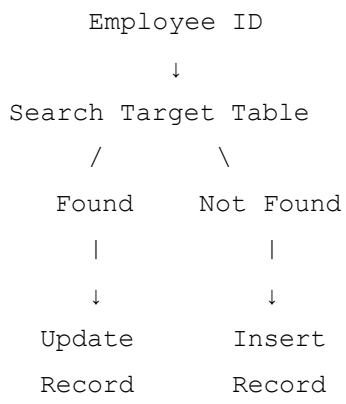

13. Step 9 – Demonstrate Coalesce

The next important demonstration is **Coalesce**.

Assume **Employee ID** is configured as the Coalesce field.

The system checks whether the Employee ID already exists in the target table.

Logic

Explanation

“If the Employee ID already exists, the system updates the existing record. If it does not exist, the system creates a new record.”

This demonstrates how duplicate records can be controlled.

14. Step 10 – Demonstrate New Record Creation

Use a spreadsheet record with a new Employee ID.

Example:

```
Employee ID: E004
Employee Name: Ravi
Department: IT
```

If `E004` does not exist in the target table:

Expected Result:

A new employee record should be created.

Demonstration Point

Open the target table and show the newly created record.

15. Step 11 – Demonstrate Existing Record Update

Use an Employee ID that already exists.

For example:

```
Employee ID: E001
Employee Name: Arun Kumar
Department: IT
```

If `E001` already exists:

Expected Result:

The existing record should be updated instead of creating a duplicate record.

Demonstration Point

Show the original record and then show the updated record.

16. Step 12 – Demonstrate Validation

The demonstration should include an invalid record.

Example:

Employee ID	Employee Name	Email
E005	Blank	invalid-email

The system should identify the invalid or incomplete data according to the configured validation rules.

Explanation

“Validation ensures that incorrect or incomplete data does not unnecessarily enter the target table.”

17. Step 13 – Demonstrate Error Handling

Show how failed records or transformation errors can be identified.

Possible errors:

- Missing mandatory field.
- Invalid email.
- Incorrect date.
- Invalid reference value.
- Transformation failure.
- Mapping issue.

Error Handling Flow

```
Invalid Data
     ↓
Validation
     ↓
Error Identified
     ↓
Review Error
     ↓
Correct Spreadsheet
     ↓
Re-import
     ↓
Verify Result
```

18. Step 14 – Verify Target Table

After the Transform Map executes, open the target table.

Verify:

- New records.
- Updated records.
- Field values.
- Transformed values.
- Mandatory fields.
- Duplicate handling.

Expected Result

The target table should contain correctly processed records from the spreadsheet.

19. Step 15 – Demonstrate Import Results

The presenter should review the import/transform results.

The results should indicate:

- Number of records processed.
- Number of records inserted.
- Number of records updated.
- Number of records that failed.
- Any transformation errors.

This provides evidence that the import process worked as expected.

20. Demonstration Test Scenarios

The following scenarios can be demonstrated:

Scenario	Input	Expected Result
Valid new record	New Employee ID	Record inserted
Existing record	Existing Employee ID	Record updated
Duplicate ID	Existing ID in spreadsheet	Coalesce applied
Missing name	Blank mandatory field	Validation/error
Invalid email	Incorrect email	Error identified
Invalid date	Incorrect date format	Transformation/validation error
Multiple records	Multiple valid rows	Records processed successfully

21. End-to-End Demonstration

The complete demonstration can be shown as:

```
Prepare Spreadsheet
        ↓
Upload Spreadsheet
        ↓
Configure/Use Data Source
        ↓
Run Import Set
```

```
        ↓
Verify Import Set Table
        ↓
Execute Transform Map
        ↓
Verify Field Mapping
        ↓
Apply Transformation
        ↓
Apply Coalesce
        ↓
Insert / Update Records
        ↓
Review Import Results
        ↓
Verify Target Table
        ↓
Demonstrate Error Handling
```

22. Key Points to Explain During Presentation

During the project demonstration, the presenter should explain these important points:

Import Set

“The Import Set is used to bring external spreadsheet data into ServiceNow and stage it for transformation.”

Import Set Table

“The Import Set Table temporarily stores the raw data imported from the spreadsheet.”

Transform Map

“The Transform Map defines how the imported source data is mapped and transformed into the target table.”

Field Mapping

“Field mapping determines which source field corresponds to which target field.”

Coalesce

“Coalesce identifies existing records and allows the system to update them instead of creating unnecessary duplicates.”

Target Table

“The target table stores the final processed records after successful transformation.”

23. Expected Demonstration Outcome

At the end of the demonstration:

- Spreadsheet data should be successfully imported.
- Import Set Table should contain the source records.
- Transform Map should execute successfully.
- Source fields should map correctly.
- Transformation rules should work correctly.
- New records should be inserted.
- Existing records should be updated.
- Duplicate handling should work correctly.
- Invalid records should be identified.
- Errors should be traceable.
- Final target records should contain the expected data.

24. Demonstration Checklist

Before the final project demonstration, verify the following:

- ☐ Spreadsheet is ready.
- ☐ Data Source is configured.
- ☐ Import Set is available.
- ☐ Import Set Table is configured.
- ☐ Target table is ready.
- ☐ Transform Map is configured.
- ☐ Field mappings are correct.
- ☐ Coalesce is configured.
- ☐ Transformation logic is tested.
- ☐ Validation is tested.
- ☐ Error handling is tested.
- ☐ Test data is available.
- ☐ New record scenario is ready.
- ☐ Existing record scenario is ready.
- ☐ Final target records can be verified.

25. Final Project Demonstration Statement

The Project Demonstration Phase presents the complete working of the “Import Data Using Transform Maps (Spreadsheet)” solution. The demonstration starts with preparing and uploading a spreadsheet, followed by loading the data into an Import Set Table. The Transform Map is then executed to perform field mapping, data transformation, validation, and Coalesce-based duplicate handling. The demonstration verifies both new record creation and existing record updates and also shows how invalid data and import errors are handled. Finally, the processed records are verified in the target ServiceNow table, demonstrating that the complete spreadsheet-to-target-table data import process works as designed**.**
